

H1: at matched ventilation, less dead space means a lower PaCO_2 — but ventilation is not what is held fixed in a patient

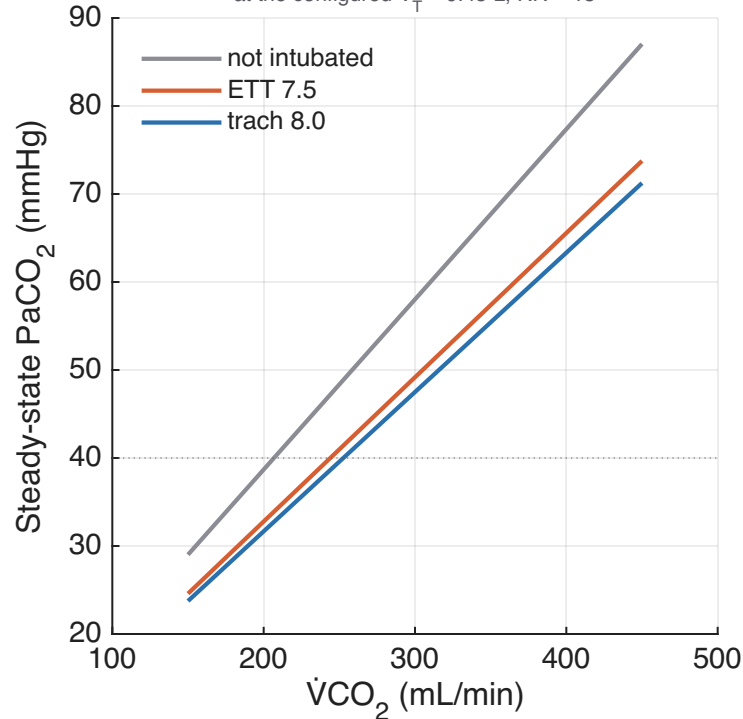

PaCO_2 at matched ventilation (RR = 18)

a counterfactual: PaCO_2 is regulated, not V_E

PaCO_2 rises linearly with CO_2 production

at the configured $V_T = 0.45$ L, RR = 18

The dead-space gap, isolated

the device step is a fraction of the bypass step
